SER-FIQ: UNSUPERVISED ESTIMATION OF FACE IMAGE QUALITY BASED ON STOCHASTIC EMBEDDING ROBUSTNESS

- Face image quality: estimate the suitability of a face image for face recognition

- Recent works proposed solely supervised solutions

  - **Human labels**
    - Transfers human bias
    - May not know the best characteristics

  - **Artificial labels**
    - Based on comparison scores
    - Biased by low-quality samples

SER-FIQ: UNSUPERVISED ESTIMATION OF FACE IMAGE QUALITY BASED ON STOCHASTIC EMBEDDING ROBUSTNESS

Main contribution

- Novel concept of measuring face image quality
  - Using robustness of a representation as quality indicator
  - Robustness against dropout-variations

Some results
